

WHAT IS CLAIMED IS:

1. A device for dispensing a flowable material from a container, the device comprising:
a base attachable to the container;
5 a first member operably in contact with the base and including a generally frustoconical extension with a tapered tip, the tip having a lower rim radially extending from the extension, the first member defining a pathway for the flowable material when the flowable material is urged from the container;
a second member disposable about the first member extension; and
10 a cap hinged to the second member.
2. The device of claim 1, in which the base is threadably attachable to the container.
3. The device of claim 1, in which the base includes a plurality of gripping surfaces.
15
4. The device of claim 1, in which the first member can be rotated within the base when said device is assembled.
5. The device of claim 1, in which the second member can be rotated about the first
20 member, when said device is assembled and attached to the container.
6. The device of claim 1, the first member comprising a first member mating structure and the second member comprising a second member mating structure, the second member mating structure engaging the first member mating structure to maintain the first member and
25 second member in a substantially fixed relation.
7. The device of claim 1, the first member further comprising a basal portion and in which the first member frustoconical extension extends from the first member basal portion.
- 30 8. The device of claim 7, the first member basal portion displaying a proximal end and a distal end, the flange disposed proximate the proximal end.

9. The device of claim 1, in which the cap is sealingly disposable over the tapered tip.

10. The device of claim 1, the cap including a plug sealingly accommodated in the pathway.

5

11. A container in combination with the device of claim 1, the device of claim 1 attached to the container.

12. A container in combination with the device of claim 11, in which the device of claim 1
10 is threadably attached to the container.

13. A method of making a dispenser for a container, the method comprising:
contacting an upper surface of a first member flange to a lower surface of a base, the
base connectable to the container;

15 fitting a second member about a generally frustoconical extension of the first member
such that the second member and the first member are frictionally engaged and such that a tip
of the frustoconical extension extends from the second member; and
attaching a cap to the second member.

20 14. The method of claim 13, in which the cap is attached to the second member by a
hinge.

15. A method of dispensing a material from a container through a dispenser, the dispenser
including a base threaded to the container, a first member, a second member, and a cap, the
25 first member sealingly in contact with the container and the base and including a generally
frustoconical extension with a tapered tip, the tip with a lower rim extending radially beyond
the remainder of the frustoconical extension, the first member defining a generally coaxial
pathway for the flowable material, the second member disposable about the frustoconical
extension and attached to the cap, the method including:

30 displacing the cap from a closed position to an open position; and
urging the material from the container, through the pathway, and onto a surface.

16. The method of claim 15, further comprising returning the cap to the closed position.
